Imagine a bird, tall and graceful, with a long neck and an even longer beak, that's what a crane looks like! These majestic birds can be as tall as 4 feet, and their wingspan can reach up to 6 feet across! While many types of cranes are a dull grey, some can be white, brown, and even gold. And don't forget about their red crown, it's a patch of skin on the top of their head that turns brighter when they're excited!

Speaking of excitement, can you guess what cranes love to eat? They're not picky eaters at all, they love to snack on insects, small mammals, and even fish if they can find them! Sometimes, they'll also eat grains and berries, especially when they're getting ready for their long migration trips. That's right, cranes are travelers who can travel thousands of miles to find the perfect spot to live.

Have you ever wondered where these traveling birds call home? Cranes live in all sorts of places, from the wetlands of Africa to the cold tundra of

Siberia. They prefer to live near water and they build their nests in shallow water or on the ground near water. The mother crane usually lays two eggs and both the mother and father take turns sitting on the eggs until they hatch.

Cranes aren't just important to the ecosystem, they're important to us humans, too! In many cultures, cranes are symbols of luck, longevity, and peace. They're also helpful to farmers because they eat pests that can destroy crops. So next time you see a crane, remember how special and important they are to our world.
